NOTE: This is a 'working draft' sequence. It currently consists of 14 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   18113 128212: contig of 9483 bp in length 18213 128212: gap of 100 bp 18213 135676: contig of 7464 bp in length 18213 135676: gap of 100 bp 18777 136672: contig of 2896 bp in length 18673 13772: gap of 100 bp 18773 151826: contig of 13054 bp in length 1877 151926: gap of 100 bp 18773 151926: gap of 100 bp 18773 164256: contig of 12330 bp in length 1927 164256: contig of 12330 bp in length.

On Apr 19, 2002 this sequence version replaced gi:20145317.

During sequence assembly data is compared from overlapping clones.

Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either dunble-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and respeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was contirmed by restriction digest. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em. EMBL; $x; $NISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information on the WORMPEP database can be found at

Chromosome 13, constructed by the Sanger Centre Chromosome 13

Mapping Group. Purther information can be found at

The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Length 207772;

It currently consists of 11 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the apps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

It currently consists of 10 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as "runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

variation annotation may not be found in the sequence submission corresponding to the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:

Em., EMBL; Sw., SWISSPROT; Tr., TREMBL; Wp., WORNDEP; Information on the WORNDEP database can be found at http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence was generated from part of bacterial clone contigs of human echromosome 1, constructed by the Sanger Centre Chromosome 1 Mapping Group, Further information, can be found at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality > 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest, except on the rare occasion of the clone being a YAC.
                                                                                                                                                                                                                                                                                                                                                                                                           constructed by the group
                         On Mar 23, 2003 this sequence version replaced gi:18476714.
During sequence assembly data is compared from overlapping clones.
Where differences are found these are annotated as variations

```
cencodes an invertase different from the plants endogenous invertase; (j)
plant that contains in one (or preferably many) cells both (II) and (Ia)
(i) kseeds from plants of (e), (i) and (j), and (m) method for
cloning a produced by plants of (e), (i) and (j), and (m) method for
cloning a promoter that is functionally homologous with (I). Constructs
containing (I) and an invertase-encoding sequence are used to produce
male-sterile plants (by co-suppression or antisense techniques) for
preparation of hybrids, while constructs that contain (I) and a
heterologous invertase-encoding sequence are used to prepare restorer
plants (which allow propagation of the male-sterile plants). Seeds from
these plants are used for in vitro embryogenesis of haploid or (double)
diploid plants, and the new plants particularly produce seedless fruits.

(I) can also be used to prepare transgenic plants that show increased or
reduced production of endogenous materials, e.g. of plant hormones or
provide high level expression in a tissue- and time-specific manner, and
contains involved in provision of energy to developing tissue. (I)
contains involved in provision of energy to developing tissue. (I)
contains the expense transgenic and time-specific manner, and
contains involved in the contain (e.g. temperature or chemicals) for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1376
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1436

\ L L .	New tapetum- and pollen-specific promoter from tobacco, useful for preparing male sterile plants, particularly those with seedless fruits.
X & X	Example 4.3; Page 68-70; 74pp; German.
₹88	This invention describes a novel nucleic acid (I) comprising a promoter
88	that is specific for taperum and polien. The invention also describes (at expression system containing at least one (I); (b) nucleic acid construct
ខ្ល	(II) containing (I) plus at least part of an expressible nucleic acid(III); (c) vector containing (I), the system of (a), or (II); (d) cells,
ខ្លួ	particularly plant cells, containing (I), the system of (a), (II) or the vector of (c); (e) plants containing cells of (d); (f) seeds from the
ខ្លួ	plants of (e); (g) hybrid seed produced by crossing a male sterile plant of (e); (h) production of male sterile plants by introducing (II) into a
88	cell and regeneration to a plant; (i) restorer plants containing in one (or preferably many) cells a construct (IIa) of (I) and a sequence that
88	encodes an invertase different from the plants endogenous invertase; (j) plant that contains in one (or preferably many) cells both (II) and (IIa)
38	(k) seeds from plants of (i) and (j); (l) fruits, particularly seeds and enclared by plants of (e). (i) and (i): and (m) method for

cloning a promoter that is functionally homologous with (I). Constructs containing (I) and an invertase-encoding sequence are used to produce male-sterile plants (by co-suppression or antisense techniques) for preparation of hybrids, while constructs that contain (I) and a heterologous invertase-encoding sequence are used to prepare restorer plants (which allow propagation of the male-sterile plants). Seeds from these plants are used for in vitro embryogenesis of haploid or (double) diploid plants, and the new plants particularly produce seedless fruits. (I) can also be used to prepare transgenic plants that show increased or reduced production of endogenous materials, e.g. of plant hormones or proteins involved in provision of energy to developing tissue. (I) provide high level expression in a tissue- and time-specific manner, and do not require exogenous stimuli (e.g. temperature or chemicals) for regulation

New antisense compound targeted to a nucleic acid molecule encoding phosphotyrosyl phosphatase activator, for modulating expression of phosphotyrosyl phosphatase activator or treating hyperproliferative disorders

Example 15; SEQ ID NO 11; 131pp; English.

The invention relates to a compound 8-80 nucleobases in length targeted to a nucleic acid molecule encoding phosphotyrosyl phosphatase activator (FTPA), that specifically hybridises with the nucleic acid molecule encoding phosphotyrosyl phosphatase activator and inhibits the expression of phosphotyrosyl phosphatase activator and inhibits the expression of phosphotyrosyl phosphatase activator i.e. ana antisense compound and a pharmaceutical carrier or diluent, a method of inhibiting the expression of phosphotyrosyl phosphatase activator in cells or tissues, a method of treating an animal having a disease or condition associated with phosphotyrosyl phosphatase activator in cells or tissues, an antisense compound. The disease or condition is a hyperproliferative disorder or developmental disorder. The compound, particularly the disorder or developmental disorder. The compound, particularly the antisense oligonucleotide is useful in modulating the function of nucleic antisense compound can also be used as research tools and diagnostics. It can also be used as tools in differential and/or combinatorial analyses to elucidate expression patterns of a portion or the entire complement of genes expressed within cells and tissues. The compound can also be used for treating diseases or conditions associated with phosphotyrosyl

(first entry)

```
Detecting and differentiating between hematopoietic cell proliferative disorders, comprises contacting a target nucleic acid with a reagent that distinguishes between methylated and non-methylated CpG dinucleotides.
                                               Haematopoietic cell proliferation disorder related DNA sequence #386.
                                                                  Human; haematopoietic cell proliferation disorder; cytostatic; gene therapy; lymphocytic leukaemia; acute myelogenous leukaemia; cytosine methylation state; gene; ds.
                                                                                                                                                                                                                                                            Piepenbrock C, Adorjan

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         lymphocytic leukaemia and actor, repellent leukaemia; as probes for determining the cytosine methylation state and/or single nuclectide polymorphisms (SNPs) of haematopietic cell proliferation disorder related sequences and their complements; and as primers for the amplification of haematopoietic cell proliferation disorder related DNA sequences. The nucleotide sequences from the present invention can also be used for detecting a predisposition to, differentiation between subclasses, diagnosis, prognosis, treatment and/or monitoring of haematopoietic call proliferative disorders. The present method enables highly specific classification of haematopoietic cell proliferative disorders allowing for improved and informed treatment of patients
                                                                                                                          differentiating between hamatopoietic cell proliferative disorders associated with at least 1 gene and/or their regulatory regions in a subject. The method comprises contacting a target nucleic acid in a biological sample obtained from the subject with at least 1 reagent, which distinguishes between methylated and non-methylated CDG dinucleotides within the target nucleic acid. ABZ030861 to ABZ1118 represent specifically claimed nucleotide sequences from the present invention. Oligonucleotides from the present invention can be used: for differentiating between hally hamatopoietic cells and proliferative disorder haematopoietic cells in acute acute
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         2550 TTTTAATTTAATTTAAATTTAATTTTATTTTTATTTTCATTAATATTTAATTAT

The invention relates to a nucleic acid (I) comprising a segment of 18 bases of chemically pretreated DNA of angiogenesis-associated genes (II) having sequences (ABQ66971-ABQ67178) or their complements. (I), also related oligomers, are used to evaluate the methylation status and/or single-nucleotide polymorphisms, in angiogenesis-related genes, for diagnosis and treatment of eye diseases, proliferative retinopathy, neovascular glaucoma, solid tumours, inflammation, rheumatoid arthritis, diabetic retinopathy, macular degeneration caused by neovascularisation.
                                                                                                                                                                                                                                                                                                                                            psoriasis, arteriosclerosis, inflammatory bowel diseases, ulcers and Croin's disease. Note: The sequence dated for this patent did not form part of the printed specification, but was obtained in electronic formadirectly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                           nucleic acid fragments from chemically treated angiogenesis-
ociated genes, useful for determining methylation status, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 37515 BP; 11428 A; 425 C; 7165 G; 18497 T; 0 U; 0 Other;
